

Benefits from Software Developer's Perspective

- **Focusing resources in developer's primary task:** Developer resources should not be used for localization but for software development that often involves tight schedules. Multilizer can separate localization from programming and thus developers can work more effectively on their primary task.
- **Reduced workload:** Localization can be done on the executable file. There are no changes in the source code and localization can be done completely without development work. The translator can do minor user-interface modifications with Multilizer's visual editors without altering the source code.
- **Fewer questions from translators:** Translators can see the context of the user-interface texts using Multilizer's visual editors (visual previews).
- **Easy project source code control:** As localization can be done on the executable file, there are no changes in the source code.
- **Experience and Knowledge:** Multilizer's technical localization experts can give answers to your in depth localization questions. You do not need to tackle the technical challenges yourself as you can utilize Multilizer's knowledge.
